Description

The **MLB/224 Steel Litter Bin** is a twin version of the **MLB/112**, (*right*) which benefits from the same durable metalwork construction but with twice the capacity.

What is this bin manufactured from?

This double litter bin is manufactured from 2mm hot dipped galvanised steel primed and powder coated in your choice of RAL colour, with a stainless steel rod hinge and slam lock as standard. Internal litter deflectors ensure that all waste is directed inside the two internal liners.

What capacity is this bin?

A large wide aperture to the front and back maximises the 224 litre capacity, which is split into two 112 litre galvanised steel liners. The larger capacity is perfect for busy areas where a more sizable capacity is needed.

Description

The **WDB/112 Dog Waste Bin** is a large capacity dog waste collection unit with an internal chute system to ensure the waste is deposited correctly.

What is this bin manufactured from?

This dog waste bin is manufactured from glass fibre composite (GFC) which is ideally suited for street furniture due to its strength and durability.

We've been manufacturing glass fibre products since 1982, using a technique exclusively developed by Wybone whereby a core material is encapsulated using fire retardant glass fibre polyester resins.

A wooden carcass is built from scratch and then carefully sprayed with glass fibre composite resins to form a hardwearing bin. These are then hand-painted and beautifully finished by our skilled team – some of which have worked in this department for over 40 years! Watch the **full video** to see how our glass fibre bins are made.

What are the advantages of GFC?

Glass fibre composite is completely unaffected by extreme weather conditions and salt water, which allows the bin to be placed outdoors, including in coastal or roadside locations and remain intact for years.

Our glass fibre litter bins have substantial durability; some of our units have been in situ for the best part of two decades. GFC products offer substantial fire protection, conforming to BS 476 Part 7 and Part 6, fire rated at Class 1/0 Building Regulations. GFC has a low carbon footprint due to the longevity of the product.
